

Global Earth Products and Liaoning WoTu sign Cooperation Agreements

Toronto, Ontario, Canada - (April 9, 2016) - Toronto based Global Earth Products (GEP) and Shenyang, China, based Liaoning WoTu Environmental Remediation Technology Co. Ltd. (Liaoning WoTu) signed a scientific and technological cooperation agreement and an organic fertilizer repurchase agreement today. Liaoning WoTu will use GEP's patented Marvel technology process (Marvel Process) in the province of Liaoning and six other provinces in Northern China on an exclusive basis to treat organic waste and create a high-quality organic fertilizer that GEP will exclusively sell in North America.

The Marvel Process was invented by Tom Smith of Utopia, Ontario. Mr. Smith is a farmer and the former President of the Canadian Pork Council. The Marvel Process is patented in the US and Canada and has been certified for the reduction of greenhouse gases by Environmental Technology Verification Canada. The Marvel Process has been used at Michigan State University in East Lansing, MI, and at the University of Guelph in Canada for many years of independent research and testing for practical applications for the environmentally safe disposal of farm manure and dry agricultural waste which results in a very high-quality organic fertilizer. The Marvel Process is characterized by a high degree of mechanization and automation, short production cycle that can handle all forms of dry and liquid farm manure, kitchen waste, sewage sludge and other organic waste streams. The Marvel Process produces no odours and produces a compost and organic fertilizer with a very, very high N-P-K (Nitrogen, Potassium and Phosphate) content, that can be stored for years without any loss of nutrient value.

Organic fertilizer will not only help improve China's severely damaged agricultural soils, in North America compost and organic fertilizer is now being used for organic farming, municipal gardens, golf courses and private gardens. The use of organic waste to produce organic fertilizer not only benefits the environment by safely handling organic waste produced in both rural and urban areas, the remediation of agricultural soil is a significant environmental benefit while reducing the use of chemical fertilizer, herbicides and pesticides which are shown to be harmful to the environment through overuse.

Zhu Xuzeng, Chairman of the Liaoning WoTu Group, Executive Director and General Manager Wang Chengli, Shenyang Sino-Can Bio-Environmental Engineering Company Ltd., CEO Xu Zhonghua, and associates arrived in Toronto on April 1, and travelled to Michigan State University to visit the Marvel facility on April 4.

During the visit in the United States and Canada, the Chinese delegation members met with Marvel inventor, Tom Smith, GEP's CEO, Peter D'Cruz, the Executive Director of the Canadian Compost Council, Susan Antler, former deputy mayor of the City of Toronto, Joe Pantalone and well known environmental expert, Dr. You-Zhi Tang, and Michigan State University and the University of Guelph researchers, conducting in-depth discussions and visiting the organic fertilizer production facilities. The delegation also examined the market conditions.

More people in North America are choosing organic food options so healthier food demand will continue to rise and we can expect that sales of organic fertilizer will be

needed to fulfill this demand. Using the Marvel process in China will reduce the burning of straw and other dry agricultural waste so it will certainly help with reducing air pollution from agricultural sources which is an important issue for all urban areas of China during the two to three harvest periods each year.

About Global Earth Products.

Global Earth Products (GEP) is a company that identifies, develops and commercializes green technology solutions. GEP is building a portfolio of companies with promising green technology solutions that are commercially proven or on the verge of delivering a commercial solution.

About Liaoning WoTu Environmental Remediation Technology Co. Ltd.

Liaoning Wotu is a group company head-quartered in Shenyang, China, focussing on developing and applying solutions for green agriculture, organic foods and soil remediation.
